1 Probability Measure

A probability measure must datisfy the following three postulates:

1. $\mathbb{P}(S) = 1$

2. For each event A, the probability of A is a nonnegative real number, i.e., $\mathbb{P}(A) \geq 0$

3. if $\{A_n\}$ is an infty sequence of events if F such that, for any $i \neq j$, $A_i \cap A_j = \emptyset$, then

$$\mathbb{P}(\cup_{n=1}^{\infty}) = \sum_{n=1}^{\infty} \mathbb{P}(A_n)$$

2 Conditional Probability

Let $(S, F, \mathbb{P})$ be a probability space, and let A and B are two random events in the sample space S with $\mathbb{P}(B) \neq 0$. Then the Conditional probability of A given B is defined by

$$\mathbb{P}(A|B) = \frac{\mathbb{P}(A \cap B)}{\mathbb{P}(B)}$$

$$\mathbb{P}(A \cap B) = \mathbb{P}(A|B)\mathbb{P}(B) = \mathbb{P}(B|A)\mathbb{P}(A)$$

Let n random events

3 Discrete Uniform Distributions

Definition

A discrete random variable X is said to have a *discrete uniform distribution*, and it is called a *discrete uniform variable*, if it can take on k different values: $x_1, x_2, ..., x_k$, and its probability distribution $f(x)$ is given by

$$f(x_i) = \frac{1}{k}$$

where $i = 1, 2, ..., k$.

Mean and Variance

$$\begin{aligned}
\mathbb{E}[X] =& \sum_{i=1}^{k} x_i f(x_i) \\
=& \frac{1}{k} \sum x_i \\
\mathbb{E}[X^2] =& \sum_{i=1}^{k} {x_i}^2 f(x_i) \\
=& \frac{1}{k} \sum x_i^2 \\
var(X) =& \mathbb{E}[X^2] - (\mathbb{E}[X])^2 \\
=& \frac{1}{k} \sum x_i^2 - (\frac{1}{k} \sum x_i)^2
\end{aligned}$$

4 Bernoulli Distributions

Definition

Support that and experiment has two possible outcomes: success and failure, and their probability are respectively, θ and $1 - \theta$. Then, this experiment is called a *Bernoulli Distributions*. Let X be the number of successes of a Bernoulli experiment, i.e. $X = 1$ or $X = 0$. Then, X is called a random variable having the Bernoulli probability distribution, which is given by

$$f(x; \theta) = \theta^x (1 - \theta)^{1-x}$$

where $x = 0, 1$ and $0 < \theta < 1$ is a parameter.

Mean and Variance

$$\begin{aligned}
\mathbb{E}[X] =& \theta \\
\mathbb{E}[X^2] =& \theta \\
var(X) =& \mathbb{E}[X^2] - (\mathbb{E}[X])^2 \\
=& \theta - \theta^2 \\
=& \theta(1-\theta)
\end{aligned}$$

5 Binomial Distributions

Definition

Let n be a nutural number, and let $0 < \theta < 1$. Then, a discrete random variable X is said to have a *binomial distribution*, and X is called a binomial random variable, if its probability distribution $b(x; n, \theta)$ is given by

$$b(x; n, \theta) = C_n^x \theta^x (1-\theta)^{n-x}$$

where $x = 1, 2, ..., n$,n and θ are two parameters, and

$$C_n^x = \frac{n!}{x!(n-x)!}$$

is the total number of combinations of n distinct numbers taken x numbers at a time.

Remark

We consider n independent Bernoullis experiments, in which the parameter θ (the probability of a success) is the same for each experiment. Let X be the total number of successes in this sequence of n independent Bernoullis experiments. Then, we can see that X is a random variable having a binomial distribution with parameters n and θ, i.e., we have the following result.
Let $X_1, X_2, ..., X_n$ be n independent Bernoulli random variables with the same parameter θ. Then, the random variable $X = X_1 + X_2 + ... + X_n$ has a binomial distribution with parameters n and θ.

Mean and Variance

$$\begin{aligned}
\mathbb{E}[X] =& n\theta \\
var(X) =& var(x_1 + X_2 + ... + X_n) \\
=& var(X_1 + X_2 + ... + X_{n-1}) + var(X_n) - 2cov(X_1 + X_2 + ... + X_{n-1}, X_n) \\
& ... \\
=& var(X_1) + var(X_2) + ... + var(X_n) \\
=& n\theta(1-\theta)
\end{aligned}$$

Theorem

$$
\begin{aligned}
b(x;n,\theta) =& C_n^x \theta^x (1-\theta)^{n-x} \\
=& C_n^{n-x} (1-\theta)^{1-\theta} \theta^x \\
=& b(n-x; n, 1-\theta)
\end{aligned}
$$

Since a binomial random variable X with parameters n and θ is the total number of successes in n independent Bernoullis experiments. $Y = \frac{X}{n}$ is the proportion of successes in n independent Bernoullis experiments.

$$\mathbb{E}[Y] = \theta$$

$$var(Y) = \frac{\theta(1-\theta)}{n}$$

6 Negative Binomial Distributions

Definition

Let k be a nutural number and let $0 < \theta < 1$. Then, a discrete random variable Y is said ti have a (Pascal) negative binomial distribution, and it is called a (Pascal) negative binomial random variable, if its probability distribution $b^*(y;k,\theta)$ is given by

$$b^*(y;k,\theta) = C_{y-1}^{k-1} \theta^k (1-\theta)^{y-k}$$

where k and θ are two parameters.

Mean and Variance

$$
\begin{aligned}
\mathbb{E}[Y] =& \sum_{i=k}^{\infty} i b^*(i; k.\theta) \\
=& \sum_{i=k}^{\infty} i C_{i-1}^{k-1} \theta^k (1-\theta)^{i-k} \\
& ... \\
=& \frac{k}{\theta} \\
var(Y) =& \frac{k}{\theta}(\frac{1}{\theta} - 1)
\end{aligned}
$$

Theorem

Let Y be a negative binomial random variable with parameters k and θ. Then for each $y = k, k+1 ...$,

$$b^*(y;k,\theta) = \frac{k}{y} b(k; y, \theta)$$

Proof. By the definition, we have

$$\begin{aligned} b^*(y;k,\theta) =& C_{y-1}^{k-1}\theta^k(1-\theta)^{y-k} \\ =& \frac{(y-1)!}{(k-1)!(y-k)!}\theta^k(1-\theta)^{y-k} \\ =& \frac{k}{y}\frac{y!}{k!(y-k)!}\theta^k(1-\theta)^{y-k} \\ =& \frac{k}{y}b(k;y,\theta) \end{aligned}$$

□

7 Geometric Distributions

Definition

If X is a (Pascal) negative binomial random variable with parameters $k = 1$ and θ, we say that this random variable X has a geometric distribution, and we also call this random variable as a geometric random variable. By the definition of negative binomial distribution, we see that the probability distribution $g(x;\theta) = b^*(x;1,\theta)$ of geometric distribution is given by

$$g(x;\theta) = \theta(1-\theta)^{x-1}$$

where θ is a parameter.

Mean and Variance

$$\begin{aligned} \mathbb{E}[X] =& \frac{1}{\theta} \\ var(X) =& \frac{1}{\theta}(\frac{1}{\theta}-1) \end{aligned}$$

Theorem

The geometric distribution has the memoryless property, i.e. if X is a geometric random variable, then, for any nature n,

$$\mathbb{P}(X = x+n|X > n) = \mathbb{P}(X = x)$$

8 Hyper-geometric Distributions

Definition

A random variable X is said to have a hyper-geometric distribution, and it is referred to as a hyper-geometric random variable, if its

probability distribution is given by

$$h(x; n, N, k) = \frac{C_k^x C_{N-k}^{n-x}}{C_N^n}$$

for $x = 0, 1, ..., n$ with $x \leq k$ and $n - x \leq N - k$, where n, N, k are parameters.

Mean and Variance

$$\mathbb{E}[X] = \frac{nk}{N}$$
$$var(X) = \frac{nk(N-k)(N-n)}{N^2(N-1)}$$

9 Possion Distributions

Definition

A discrete random variable X is said to have a Possion distribution, and it is referred to as a Possion random variable, if its probability distribution is given by

$$p(x; \lambda) = \frac{\lambda^x}{x!} e^{-\lambda}$$

Mean and Variance

$$\mathbb{E}[X] = \lambda$$
$$var(X) = \lambda$$

10 Multivariate Distributions

10.1 Polynomial Distributions

Definition

The k random variable $X_1, X_2, ..., X_k$ are said to have a polynomial distribution, and they are referred to as polynomial random variable, if their joint probability distribution is given by

$$f(x_1, ..., x_k; \theta_1, ..., \theta_k) = \frac{n!}{x_1!...x_k!} \theta_1^{x_1} ... \theta_k^{x_k}$$

for $x_i = 0, 1, ..., n$ **and** $0 < \theta_i < 1$ **for each** $i = 1, ..., k$**, where**

$$n = \sum_{i=1}^{k} x_i$$

$$\sum_{x=1}^{k} \theta_i = 1$$

10.2 Multivariate Hyper-geometric Distributions

Definition

The k **random variable** $X_1, ..., X_k$ **are said to have a multivariate hyper-geometric distribution, and ther are referred to as multivariate hyper-geometric random variable, if their joint probability distribution is given by**

$$f(x_1, ..., x_k; n, j_1, ..., j_k) = \frac{C_{j_1}^{x_1} ... C_{j_k}^{x_k}}{C_N^n}$$

for $x_i = 0, 1, ..., n$ **with** $x_i \leq j_i$ **for each** $i = 1, ..., k$**, where**

$$n = \sum_{i=1}^{k} x_i$$

$$N = \sum_{i=1}^{k} j_i$$

11 Uniform Densities

Definition

A continuous random variable X **is said to have a uniform density withe parameters** α **and** β**, and it is referred to as a continuous uniform random variable, if its probability density is given bu**

$$f(x) = \frac{1}{\beta - \alpha}$$

for $\alpha < x < \beta$**, and** $f(x) = 0$ **elsewhere, where** α **and** β **are two parameters with** $\alpha < \beta$**.**

Mean and Variance

$$\mathbb{E}[X] = \frac{\alpha + \beta}{2}$$

$$var(X) = \frac{(\beta - \alpha)^2}{12}$$

12 The Gamma Function

Definition

The gamma function $\Gamma(x)$ is a real function which is defined on $(0, \infty)$ and is given by

$$\Gamma(x) = \int_0^\infty y^{x-1} e^{-y} dy$$

for each $x \in (0, \infty)$

Theorem

$$\Gamma(n) = (n - 1d)!$$

for each natural number n.

$$\Gamma(\frac{1}{2}) = \sqrt{\pi}$$

13 The Beta Function

Definition

The beta function $B(u, v)$ is a real bivariate function, which is defined for each $(u, v) \in (0, \infty) \times (0, \infty)$, and is given by

$$B(u, v) = \int_0^1 t^{u-1}(1 - t)^{v-1} dt$$

Theorem

The gamma function and the beat function satisfy the following equation

$$B(u, v) = \frac{\Gamma(u)\Gamma(v)}{\Gamma(u + v)}$$

for any $(u, v) \in (0, \infty) \times (0, \infty)$

14 Gamma Distributions

Definition

A random variable X is said to have a gamma distribution, and it is referred to as a gamma random variable, if its probability density is

given by

$$f(x) = \frac{1}{\beta^\alpha \Gamma(\alpha)} x^{\alpha-1} e^{-\frac{x}{\beta}}$$

for $x > 0$, and $f(x) = 0$ for $x \leq 0$, where $\alpha > 0$ and $\beta > 0$ are two parameters.

Theorem

The r-th moment of a gamma distribution with parameters α and β is given by

$$\mu'_r = \frac{\beta^r \Gamma(\alpha + r)}{\Gamma(\alpha)}$$

Mean and Variance

$$\begin{aligned} \mathbb{E}[X] =& \alpha\beta \\ var(X) =& \alpha\beta^2 \end{aligned}$$

15 Beta Distributions

Definition

A random variable X is said to have a beta distribution, and it is referred to as a beta random variable, if its probability density is given by

$$f(x) = \frac{\Gamma(\alpha + \beta)}{\Gamma(\alpha)\Gamma(\beta)} x^{\alpha-1} (1 - x)^{\beta-1}$$

Theorem

The r-th moment of a beta distribution with parameters α and β is given by

$$\mu'_r = \frac{\Gamma(\alpha + \beta)}{\Gamma(\alpha)} \frac{\Gamma(\alpha + r)}{\Gamma(\alpha + \beta + r)}$$

Mean and Variance

$$\begin{aligned} \mathbb{E}[X] =& \frac{\alpha}{\alpha + \beta} \\ var(X) =& \frac{\alpha\beta}{(\alpha + \beta)^2 (\alpha + \beta + 1)} \end{aligned}$$

16 Exponential Distributions

Definition

Let X be a gamma random variable with parameters α and β. If $\alpha = 1$ and $\beta = \theta$, this random variable X is said to have an exponential distribution, and it is referred to as an exponential random variable. The density of exponential distribution is given by

$$f(x) = \frac{1}{\theta} e^{-\frac{x}{\theta}}$$

for $x > 0$, and $f(x) = 0$ for $x \leq 0$

Theorem

The exponential distribution satisfies the memoryless property, i.e., if X is an exponential random variable, then, for each $t > 0$,

$$\mathbb{P}(X \geq x + t | X \geq t) = \mathbb{P}(X \geq x)$$

Mean and Variance

$$\begin{aligned} \mathbb{E}[X] =& \theta \\ var(X) =& \theta^2 \end{aligned}$$

17 Normal Distributions

17.1 The Standard Normal Distributions

Definition

A random variable Z is said to have the standard normal distribution, and so that it is called a standard normal distribution variable and it is denoted by $Z \sim N(0,1)$, if its density is given by

$$\phi(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}z^2}$$

17.2 Normal Distributions

Definition

Let X be a normal random variable with parameters μ and $\sigma > 0$, and let $Z = \frac{X-\mu}{\sigma}$. Then, Z is a standard normal random variable, i.e., $Z \sim N(0,1)$

Mean and Variance

$$\mathbb{E}[X] = \mu$$
$$var(X) = \sigma^2$$

17.3 The Normal Approximation

Let X_n be a random variable having a binomial distribution with parameters n and θ, and let

$$Z_n = \frac{X_n - n\theta}{\sqrt{n\theta(1-\theta)}}$$

18 Bivariate Normal Distributions

Definition

A pair of random variables (X_1, X_2) is said to have a bivariate normal distribution, and X_1 and X_2 are referred to as jointly normal distributed random variables, if their joint density is given by

$$\Phi(x_1, x_2) = \frac{1}{2\pi\sigma_1\sigma_2\sqrt{1-\rho^2}} e^{-\psi(x_1,x_2)}$$

for $(x_1, x_2) \in \mathbb{R}^2$ where

$$\psi(x_1, x_2) = \frac{1}{2(1-\rho^2)}\left(\frac{(x_1-\mu_1)^2}{\sigma_1^2} - 2\rho\frac{(x_1-\mu_1)(x_2-\mu_2)}{\sigma_1\sigma_2} + \frac{(x_2-\mu_2)^2}{\sigma_1^2}\right)$$

and $\mu_i, \sigma_i > 0$ with $i = 1, 1$, and $|\rho| < 1$ are all parameters.

Theorem

The marginal densities are respectively given by

$$\phi_1(x_1) = \frac{1}{\sigma_1\sqrt{2\pi}} e^{-\frac{(x_1-\mu_1)^2}{2\sigma_1^2}}$$

$$\phi_2(x_2) = \frac{1}{\sigma_2\sqrt{2\pi}} e^{-\frac{(x_2-\mu_2)^2}{2\sigma_2^2}}$$

The covariance of X_1 and X_2 is given by

$$cov(X_1, X_2) = \rho\sigma_1\sigma_2$$

X_1 **and** X_2 **are independent,if and only if** $\rho = 0$

19 The Distribution Function Technique

Let X be a random variable with the distribution function $F(x)$, and let $Y = u(X)$, where $u(x)$ is an increasing function such that its inverse function $x = u^{-1}(y)$ exists. Then the distribution function of Y is given by

$$G(y) = F(u^{-1}(y))$$

for all real numbers y in the range of Y.

20 The Transformation Technique

Let X be a random variable whose density function is $f(x)$, and let $y = u(x)$ is a differentiable function such that its inverse function $x = u^{-1}(y)$ exists. Then, the density function $g(y)$ of $Y = u(X)$ is given by

$$g(y) = f(w(y))|w'(y)|$$

when $w'(y) \neq 0$ and $g(y) = 0$ elsewhere where $w(y) = u^{-1}(y)$.

21 Moment Generating Functions

Definition

Let X be a random variable. The moment-generating dunction of X id defined by

$$M_X(t) = \mathbb{E}[e^{tX}]$$

for each real number t in which the expectation exists, i.e., when X is continuous with density $f(x)$.

$$M_X(t) = \int_{-\infty}^{\infty} e^{tx} f(x) dx$$

when X is discrete with probability distribution $f(x)$,

$$M_X(t) = \sum_x e^{tx} f(x)$$

21.1 Some Moment-generating functions

21.1.1 Binomial random variable

$$M_X(t) = (1 + \theta(e^t - 1))^n$$

21.1.2 Possion random variable

$$M_X(t) = e^{\lambda(e^t-1)}$$

21.1.3 Gamma random variable

$$M_X(t) = (1-\beta t)^{-\alpha}$$

21.1.4 Exponential random variable

$$M_X(t) = \frac{1}{1-\theta t}$$

21.1.5 Chi-square random variable

$$M_X(t) = (1-2t)^{-\frac{v}{2}}$$

21.1.6 Normal random variable

$$M_X(t) = e^{\mu t+\frac{1}{2}\sigma^2 t^2}$$

21.2 Properties of Moment Generating Functions

$$\frac{d^k M_X(t)}{dt^k}|_{t=0} = \mu'_k = \mathbb{E}[X^k]$$

$$M_{aX+b}(t) = e^{tb} M_X(at)$$

Let X and Y be two independent random variables,

$$M_{X+Y}(t) = M_X(t)M_Y(t)$$

22 Moment Generating Function Technique

22.1 Possion Distribution

Let X_1 and X_2 be two independent random variables, and let X_1 and X_2 have the Possion distributions $p(x_1, \lambda_1)$ and $p(x_2, \lambda_2)$, respectively. Then, the random variable $Y = X - 1 + X_2$ ahs a Possion distribution

$$p(y, \lambda_1 + \lambda_2)$$

22.2 Normal Distribution

Let X_1 and X_2 be two independent random variables such that $X_i \sim N(\mu_i, \sigma_i)$, $i = 1, 2$, respectively, and let a and b be two constants such that $a^2 + b^2 \neq 0$. then, the random variable $Y = aX_1 + bX_2$ has a normal distribution with mean $\mu = a\mu_1 + b\mu_2$ and variance $\sigma^2 = a^2\sigma_1^2 + b^2\sigma_2^2$.

22.3 Exponential Distribution

Let X_1 and X_2 be two independent random variables having an exponential distributions with the same parameter θ, respectively. Then the random variable $Y = X_1 + X_2$ has a gamma distribution with $\alpha = 2$ and $\beta = \theta$
